

Introduction

Nowadays the world is in great need of our app because we are faced with the acute threat of cancer. The cancer death rate worldwide increases significantly every year. And an independent system for organ transplantation is vitally important to be created. It should be as transparent as it is only possible with no chance of editing the waiting list for transplantation. Our website indicates that along with dealing with the global challenges in a medicine field, we manage to solve current problems in a healthcare system with the help of our application.

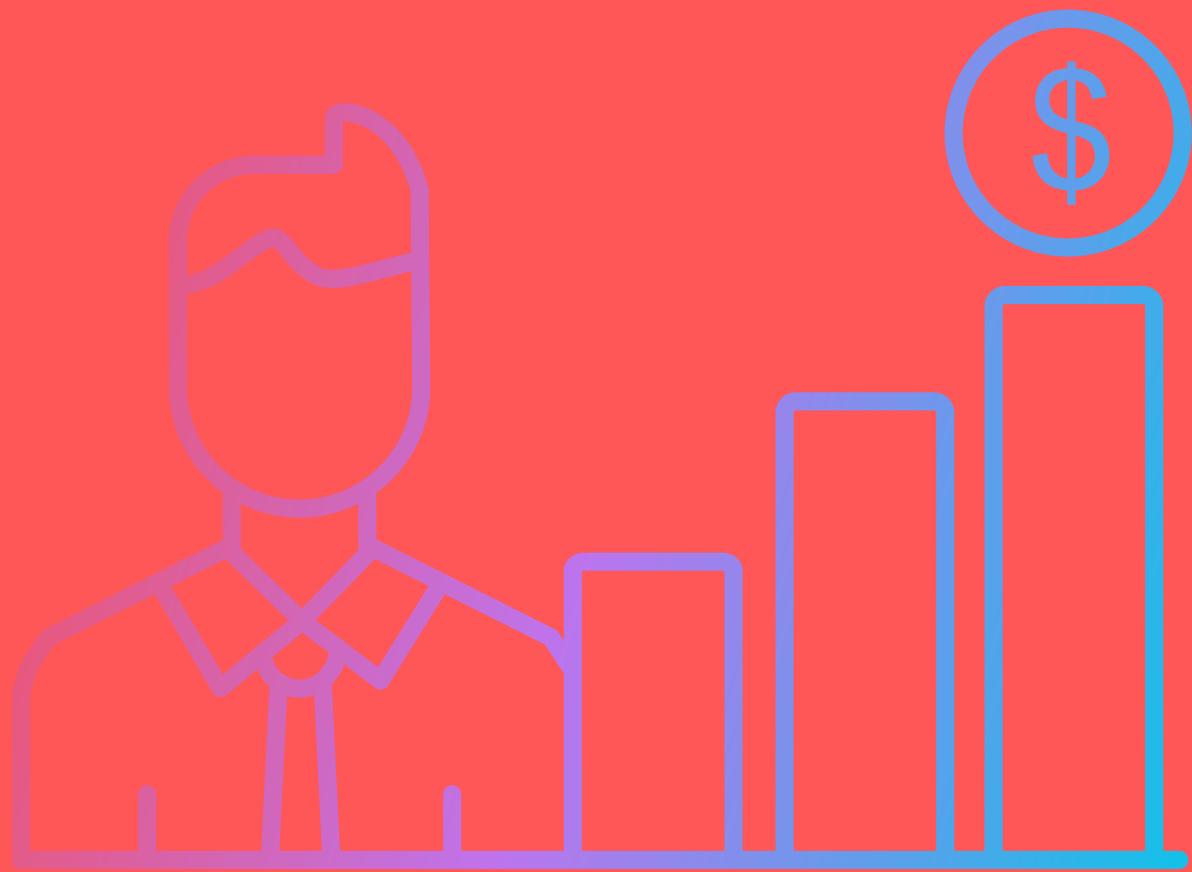

Blockchain

We create our own blockchain. We are faced with quite a difficult task of creating a decentralized blockchain that enables clinics to work and preserve the privacy between a patient and a clinic. A secure decentralized waiting list for organ transplantations has to be developed as well. As for the patient's electronic medical history records, they must also be protected, since it is the vitally important data and it should not be available to third parties.

Investors

Currently the financing of the project is planned to be provided with the help of the ICO, a closed sale of tokens and a sale of a share in the company. In all the cases, except for the ICO, all agreements with our partners will be signed, documented and will go through all the legal procedures necessary for both parties.

Tokenomics

The increase in value of our currency will be ensured by the payments for the drugs in drugstores added to our system. And thanks to the fundraising fund with the donations to be made in Antoxcoin currency as well. It is planned to be the most secure and transparent foundation with the aid to be provided to those who are in need.
